

Easy DIY Static Compost Method

Materials

- 4 yards of non-aromatic, deciduous wood chips. Such as: alder, maple, or poplar.
- 10 pounds of steel cut organic oats.
- Additionally, you can add 1 gallon of Soil ProVide and 1 pound of Soil ReVive.
(Optional)

Process

- Build the pile directly onto the soil in an area where you can avoid chemical drift, and where you do not get standing water.
- Create a 4 inch layer of wood chips, and sprinkle a very thin layer of oats. Spray with water and/or the Soil ProVide/Soil ReVive mixture.
- Repeat this process until the whole pile is built up.
- Cover the whole pile with cardboard, making sure to secure the cardboard so it doesn't blow away.
- Let it sit for 6 months to a year, **undisturbed**.

Application Rate

- 50 lbs per 1000 square feet **OR** approximately 2 yards per acre.
